

College of Computer Science and Engineering Information and Computer Science Department First Semester 141 (2014/2015)

> ICS 202 – Data Structures Final Exam Tuesday, January 6th, 2015 Time: 120 minutes

Name:	 	 	 	 	
ID#					

Section 01						
Dr. Sami						
Section 02						
Dr. Ramadan						

Question #	CLO	Max Marks	Marks Obtained	
1		20		
2		30		
3		25		
4		25		
Total		100		

Instructions

- 1. Write your name and ID in the respective boxes above and circle your section.
- 2. This exam consists of 9 pages, including this page, plus one reference sheet, containing 4 questions.
- 3. You have to answer all 4 questions.
- 4. The exam is closed book and closed notes. No calculators or any helping aids are allowed.
- 5. Make sure you turn off your mobile phone and keep it in your pocket if you have one.
- 6. The questions are not equally weighed.
- 7. The maximum number of points for this exam is 100.
- 8. You have exactly 120 minutes to finish the exam.
- 9. Make sure your answers are readable.
- 10. If there is no space on the front of the page, feel free to use the back of the page. Make sure you indicate this in order not to miss grading it.

Q.1 [20 points] Multiple Choice Questions: Mark the best answer for each question below. Note: only one choice should be chosen.

1. Consider the following code segment

```
for (int i=1, sum=0; i<n; i*=2)
    sum+=4;    // Statement 1</pre>
```

The complexity of the above code segment is

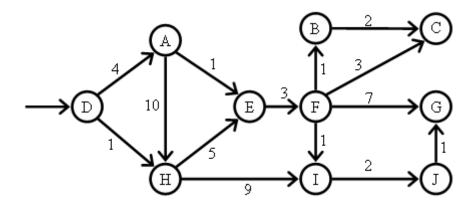

- a. $O(n^2)$
- b. $O(n \log n)$
- c. O(n)
- d. $O(\log n)$
- e. none of the above.
- 2. Consider the following code segment

```
for (int i=1, sum=0; i<n; i+=2)
    for (int j=1, sum=0; j<n; j*=2)
        sum+=4; // Statement 1</pre>
```

The complexity of the above code segment is

- a. $O(\log n)$
- b. $O(n \log n)$
- c. O(n)
- d. $O(2^n 1)$
- e. none of the above.
- 3. The big-O notation
 - a. Can compare algorithms in the same complexity class
 - b. Is an upper bound on the asymptotic complexity of the program
 - c. Is a bottom bound on the asymptotic complexity of the program
 - d. Provide a measure which is valid for different operating systems, compilers and CPUs.
- 4. Among the following operations which are more efficient in the doubly linked list compared to singly linked list:
 - a. Append
 - b. Prepend
 - c. Extract(Object ob)
 - d. ExtractFirst

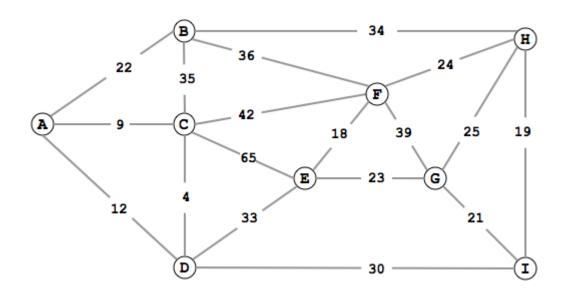

Q2. [30 points] (Graphs):
A. [10 points] Consider the following weighted directed graph G:

Apply the Dijkstra algorithm on G starting from $\mathbf{vertex}\ \mathbf{D}$:

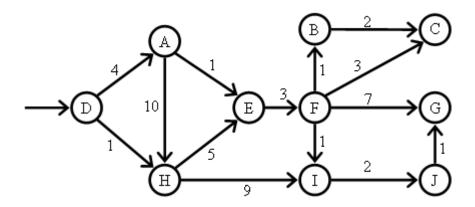

Pass	initially			We	Prede
Active Vertex				weight	Predecessor
Α					
В					
С					
D					
E					
F					
G					
Н					
I					
J					

B. [10 points] Consider the following weighted undirected graph. Apply prim's algorithm to find a minimum spanning tree of the graph starting from A. Show the minimum spanning tree.

Pass	initially			weight	٧1
Active Vertex				ight	1
Α					
В					
С					
D					
E					
F					
G					
Н					
I					

C. [5 points] How many strongly connected components graph G has? List them.

D. [5 points] Give the order of traversing the vertices according to Post-Order Depth-First.

Q3. [25 points] (Hashing):

A. [10 points] Write code to remove duplicates from an unsorted linked list using the Java predefined Hashtable structure.

```
public static void deleteDups(LinkedListNode n) {
   Hashtable table = new Hashtable();
   LinkedListNode previous = null;
```

B. [15 points] Consider inserting the following keys:

32, 33, 30, 19, 20, 25, 16, 42, 25, 29

respectively, into a hash table of size 11, using open addressing and hash function:

h(key) = key % 11

Use double hashing as a collision resolution policy with

 $h_p(key)=key\%10$

Show the hash table after the insertions, showing all your work.

0.5	[25]	points]	l: ((Compression)
V.5	40	DOME	• 1	

a) [10 points] Using Huffman coding, show the resulting Huffman coding tree for compressing the following message. Make sure you show all your work.

this is this is isss

b) [5 points] Compute the compression ratio, showing your work. Make sure you state any assumptions.

Quick Reference Sheet

```
public class SLLNode<T> {
                                          public class Queue<T> {
   public T info;
                                               private ...; // array or linked list
    public SLLNode<T> next;
                                             public Queue();
  public SLLNode();
                                             public void clear();
  public SLLNode(T el)
                                             public boolean isEmpty();
  public SLLNode(T el, SLLNode<T> ptr);
                                             public T firstEl();
                                             public T dequeue();
                                             public void enqueue(T el);
public class SLL<T> {
                                             public String toString();
   protected SLLNode<T> head, tail;
  public SLL();
  public boolean isEmpty();
                                          public class BSTNode<T extends Comparable<?</pre>
  public void addToHead(T el);
                                          super T>> {
  public void addToTail(T el);
                                             protected T el;
  public T deleteFromHead();
                                             protected BSTNode<T> left, right;
  public T deleteFromTail();
                                             public BSTNode();
  public void delete(T el);
                                             public BSTNode(T el);
  public void printAll();
                                              public BSTNode(T el, BSTNode<T> lt,
  public boolean isInList(T el);
                                                                   BSTNode<T> rt);
public class DLLNode<T> {
                                          Public class Hashtable<K,V> {
   public T info;
                                          void clear()
    public DLLNode<T> next, prev;
                                          boolean
                                                  contains(Object value)
  public DLLNode();
                                          boolean
                                                     containsKey(Object key)
  public DLLNode(T el);
                                          boolean
                                                    containsValue(Object value)
  public DLLNode(T el, DLLNode<T> n,
                                          boolean
                                                     equals(Object o)
                       DLLNode<T> p);
                                          V get(Object key)
                                                    isEmpty()
                                          boolean
                                          V put(K key, V value)
public class DLL<T> {
                                          V
                                               remove(Object key)
   private DLLNode<T> head, tail;
                                          int size()
  public DLL();
                                          String
                                                     toString()
  public boolean isEmpty();
  public void setToNull();
  public void addToHead(T el);
  public void addToTail(T el);
 public T deleteFromHead();
 public T deleteFromTail();
 public void delete(T el);
 public void printAll();
 public boolean isInList(T el);
}
```

$$\sum_{i=1}^{n} i = \frac{n(n+1)}{2}$$

$$\sum_{i=1}^{n} i^{2} = \frac{n(n+1)(2n+1)}{6}$$

$$\sum_{i=1}^{n} i^{3} = \left(\frac{n(n+1)}{2}\right)^{2}$$

$$\sum_{i=1}^{n} x^{i} = \frac{x^{n+1}-1}{x-1}$$

$$2^{\lg n} = n \qquad \lg ab = \lg a + \lg b \qquad \lg a^{b} = b \lg a$$
